ACKNOWLEDGMENTS

Appreciation is expressed to the cooperators that provided their land, equipment and time in assisting with prepping, planting, managing and harvesting of these plots throughout the year. All cooperators are listed in Table 1. In addition, we would like to extend our appreciation to **Cotton Incorporated** through the **Texas State Support Committee, Americot/NexGen, Bayer CropScience, Croplan Genetics, Delta Pine, Dyna-Gro, and Phylogen** for their partial funding of these trials.

2014 HIGHLIGHTS

Variety selection is the most important decision made during the year. Unlike herbicide or insecticide decisions that can be changed during the season to address specific conditions and pests, variety selection is made only once, and variety selection dictates the management of a field for the entire season. Variety decisions should be based on genetics first and transgenic technology second. Attention should be focused on agronomic characteristics such as yield, maturity, and fiber quality when selecting varieties. Figure 1 illustrates the cotton production regions of Texas.

From the latest data available, transgenic varieties accounted for 99% of the state acreage again in 2014. According to the USDA-Agricultural Marketing Service “Cotton Varieties Planted 2014 Crop” survey, the estimated percentage of upland cotton planted to specific Brands in Texas are as follows: Alltex had 2.5%, Americot/NexGen had 20%, Bayer CropScience – FiberMax had 39%, Bayer CropScience – Stoneville had 2.5%, Croplan Genetics had 0.5%, Delta Pine had 25%, Dyna-Grow had 3.5%, and Phylogen had 7%.

To assist Texas cotton producers in remaining competitive in the Lower Rio Grande Valley, Blacklands, South Texas/Wintergarden and Upper Coastal regions (Figure 2), the Texas A&M AgriLife Extension Service-Cotton Agronomy program has been conducting, large plot, on-farm, replicated variety trials for the past eight years. This approach provides a good foundation of information that can be utilized to assist the variety selection process. These trials occur on producer's farms and are managed by the producers.

Eighteen Replicated Agronomic Cotton Evaluation (RACE) Trials were planted in 2014 and are listed in Table 1. The 2014 season began better this year than the past few with adequate to excessive soil moisture at planting time with some isolated periods of heavy rains. In general, planting dates across most of the production regions were

delayed 2-4 weeks later than normal due to wet and cool conditions. These conditions left many producers having to make some difficult decision on whether to replant or stick with their current stand.

Yields across the state were generally at or above average in 2014. This is mainly due to starting the season with a full soil profile of moisture and some timely rainfall during the growing season. Most locations did receive some rain on the crop just prior to harvest which likely decreased lint grades. Fortunately, minimal lint was removed from the bur from the rain and yield reductions were usually small.

Mean location yields ranged from 2419 lbs/ac for the Weslaco irrigated location to 1043 lbs/ac for the Corpus Christi Center location. Mean dryland location yields ranged from 1728 lbs/ac for Matagorda Co to 598 lbs/ac for the DeWitt Co.

All the cotton seed companies with RoundupFlex® or Glytol® and Bt2® or Widestrike® technology had the opportunity to include at least one variety in the RACE trial at each location. All varieties were treated with either Aeris or Avicta Complete Pak seed treatment. Included in this publication are the cotton variety descriptions provided by company. See descriptions on page 7-11.

In addition to the RACE trials, three Monster cotton variety trials (Tables 24-26) were conducted in 2014 and the final yields and grades are provided in this publication. Table 1 provides a list of cooperators, planting and harvest dates, row spacing and plot area for each location. Tables 2 - 5 show numerical rankings based upon lint yield for the varieties across all locations within a production region. Only the varieties that were planted at a minimum of three locations for the Lower Rio Grande Valley (Table 2), five locations for the Coastal Bend Counties (Table 3), five for the Upper Coastal Bend (Table 4), and three for the Central Texas Blacklands County locations (Table 5) were included in these four tables.

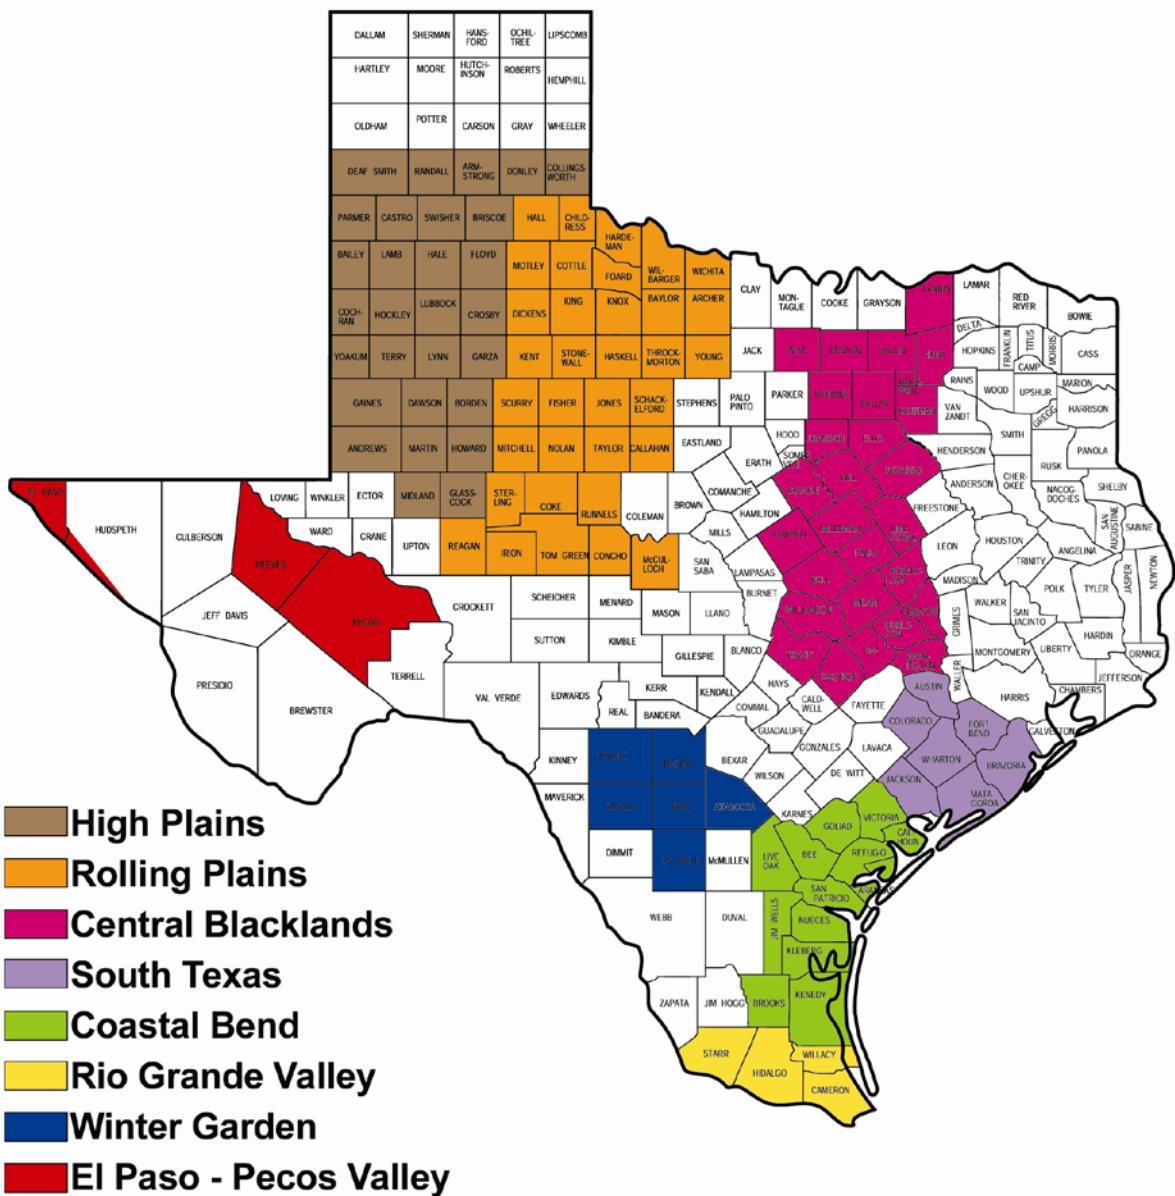

Tables 6 to 23 include the RACE trial yield data and fiber analysis for each individual location. Data featured in these tables include: statistical analysis of yield, turnout, fiber quality parameters, loan and gross lint value/acre. Most locations were ginned with a 20-saw table-top gin with no lint cleaner. This method consistently produces higher lint turnout percentages than would be common in a commercial gin. Consequently, higher turnouts equate to lint yields which are generally higher than area-wide commercial yields. Additionally, all data were standardized to a color grade and leaf of 41-4, because an accurate estimate of leaf grade and color are not possible without a lint cleaner on the gin.

The statistical analysis quantifies the variability of the test site conditions, such as soil type, harvesting, insect damage, etc. A CV (coefficient of variation) of 15% or less is generally considered acceptable and means the data are dependable. A trial with a small LSD (least significant difference) indicates more consistency within the trial and higher likelihood of identifying differences among varieties. A trial location with a large LSD and large CV indicates a higher degree of variability at the trial location. Non-statistical significance is represented as “NS” and indicates no differences among the varieties within the data column at a 95% confidence level.

Varieties that are statistically different from one another will not have the same letter next to the corresponding number value in a column. For example, Table 6 (Cameron County RACE Trial) lint yields for PHY 333WRF (2030 lbs of lint/acre) and ST 4946GLB2 (1936 lbs of lint/acre) are both followed by a letter, “a”, and thus are considered significantly similar for yield. However, ST 4946GLB2 (1936 lbs of lint/acre) and DP 1359B2RF (1770 lbs of lint/acre) do not have the same letter following each of them and are therefore considered significantly different from one another.

Figure 1. Cotton Production Regions of Texas

COTTON PRODUCTION REGIONS - TEXAS

Variety Characteristics/Highlights

Below are the cotton variety characteristics and highlights that were included in the 2014 Uniform Variety Trials and other common varieties planted in these regions. These cotton variety descriptions were provided by individual seed company representatives or publicly available information.

ALLTEX NITRO 44B2F

- Semi-smooth leaf
- Excellent seedling vigor
- Medium maturity
- Superior fiber quality with very long staple
- Premium micronaire in high micronaire conditions
- Adapted to irrigated South Texas, Texas High Plains and Concho Valley

CROPLAN GENETICS 3787B2F

- Mid maturity
- Adapted for dryland but produces good under irrigated conditions
- Excellent seedling vigor and early season emergence
- Very good storm tolerance
- Excellent fiber package

DeltaPine 0935B2RF

- Smooth leaf
- Mid maturity variety
- High gin turnout
- Nectariless trait for plant bug suppression

DeltaPine 0949B2RF

- Light-hairy leaf
- Medium-tall plant height
- Mid-full maturity variety
- High gin turnout

DeltaPine 1044B2RF

- Semi-smooth leaf
- Mid-full maturity
- Excellent fit on dryland and limited irrigation
- Very good Verticillium and Bacterial Blight resistance

DeltaPine 1048B2RF

- Semi-smooth leaf
- Medium-tall plant height
- Mid-full maturity
- Offers improved staple and uniformity

- Good Bacterial Blight and moderate Verticillium resistance

DeltaPine 1219B2RF

- Semi-smooth leaf
- Medium-tall plant height
- Early maturity variety
- Broadly adapted across Texas
- Good combination of yield and fiber quality

DeltaPine 1252B2RF

- Smooth leaf
- Medium-tall plant height
- Great fit for irrigated and more productive full season environments
-

DeltaPine 12R224B2R2

- Semi-smooth leaf
- Early maturity with very good storm resistance
- Medium/tall plant with high yield potential
- Responds to medium to high yielding management programs

DeltaPine 12R249B2R2

- Smooth leaf
- Medium/full maturing with excellent storm resistance
- Excellent fit for TX and Arizona with strong vigor
- Will respond to all management levels

DeltaPine 1359B2RF

- Smooth Leaf
- Full- season maturity
- Aggressive growth habits, requiring aggressive PGR management, especially pre-bloom
- Responsive to high-yield environments with high yield potential

DynaGro 13125B2F (experimental DynaGro cultivar)

- Semi-smooth leaf
- Medium maturity
- Good fiber quality and turnout
- Adapted to Lower Rio Grande Valley and Southeastern US

FiberMax 1830GLT

- Early/medium maturity
- Excellent fiber quality with high gin turnout
- TwinLink two-gene Bt protection against worm pests
- Liberty and glyphosate herbicide-tolerant

FiberMax 1944 GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Early-medium maturity....more towards medium maturity
- Widely adapted across entire Cotton Belt – irrigated or dryland
- Well suited for limited irrigation

FiberMax 2989GLB2

- Medium maturity variety
- Smooth leaf
- Medium-tall plant with a slightly bushy growth habit
- Benefits from early season PRG applications
- Features good fiber properties
- Well-adapted to all cotton growing areas

FiberMax 8270GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Medium to full maturity
- Okra leaf variety
- Especially well-suited for Coastal Bend dryland production

NexGen 1511B2RF

- Medium maturity
- Semi-smooth leaf
- Excellent seedling vigor
- Medium to Tall plant height
- Moderate to aggressive plant growth regulation may be necessary, especially prior to first bloom, on highly productive soils
- Broad adaptation across soil types, geographies, and production systems
- Well adapted to irrigated or dryland throughout all areas of Texas
- High turnout and very good fiber quality

NexGen 5315B2RF

- Full season maturity
- Indeterminate fruiting habit
- Smooth leaf
- Tall plant height
- Adapted to irrigated and dryland areas of south/central Texas, south delta, southeast and Arizona
- Moderate to aggressive plant growth regulation may be needed on productive soils
- High turnout and very good fiber quality

Phylogen 333WRF

- Early maturity
- Excellent seedling vigor
- Outstanding fiber quality package
- Dryland or irrigated conditions
- Hairy leaf

Phylogen 339WRF

- Indeterminate, very early maturing
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor

Phylogen 367WRF

- Indeterminate,
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Root Knot Nematode resistance

Phylogen 375WRF

- Indeterminate, often early maturing
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Has atypical high degree of yield stability and quality for an early maturing cotton

Phylogen 499WRF

- Mid-maturity variety with exceptional yield potential and very high turnout
- Aggressive growth
- Consistent across soils and environments, suited for dryland and irrigated fields
- Outstanding seedling vigor and early season growth
- Larger seed size ~ 4,000 – 4,200 seed/lb.

Phylogen 575WRF

- Full season maturity
- Excellent seedling vigor
- Excellent choice for irrigated conditions
- Tall - PGR management required
- Smooth leaf
- Excellent fiber quality package
- Performed well under irrigation in Rio Grande Valley and Winter Garden

Stoneville 4946GLB2

- Early-mid maturity
- Dual tolerance to Liberty® and glyphosate herbicides
- Root-knot nematode tolerant
- Moderately-aggressive growth habits
- Broadly adapted across all cotton growing regions

Stoneville 6448GLB2

- Full season maturity
- Dual tolerance to Liberty® and glyphosate herbicides
- Excellent seedling vigor
- Well-suited for dryland and irrigated production

Table 1. Trial location, cooperator, planting date, harvest date, row spacing, plot dimensions and area of 2014 Texas A&M AgriLife Extension RACE Trials harvested.

County	Cooperator	Planting Date	Harvest Date	Row Spacing (inches)	Plot Dimensions	Irrigated or Dryland	Area harvested/plot (acres)
Cameron	Eddie & James Bauer	Mar 31	Sep 10	40	6 rows x 1720 feet	Irrigated	0.79
